Type of exercise: _____ How many times a week: _____ How long at one time: (e.g. 30 min, 1 hr...)

Are you currently a member of an exercise facility? Yes No

Please list any other information you feel is important for your physician:

How did you hear about our weight loss program? _____

****Patient Signature:** _____ **Date:** _____ **Last 4 digits of SSN:** _____

Physician Signature: _____ **Date:** _____

Patient Consent for Treatment:

The following information concerns the purpose of our weight loss program and the risks associated with the medications used for treatment. Please read this information carefully. Ask any questions you may have prior to signing the consent for the treatment. Additionally, we recommend that you consult your primary care physician regarding this weight loss program and its effect on medications you may already be taking.

The purpose of our program is weight management through the use of dietary counseling paired with appetite suppressant medications. The medications are meant to aid in compliance with the reduction in caloric intake necessary for optimal weight loss. These medications are controlled, prescription medications; they are not without risk and may be habit forming. Because of these reasons, patients who are unable to lose an average of one pound per month after three months of medical therapy will be taken off the medication until the benefit of medication can be re-evaluated.

The primary appetite medications used for this program are phentermine (Adipex-P 37.5 mg, Ionamin 30mg., and generic), phentermine HCl (Lomaira 8mg), diethylpropion (Tenuate 25mg and 75 mg), benzphetamine (Didrex 50mg.), phendimetrazine (Bontril 35 mg and 105mg), *Belviq (lorcaserin HCl) & Belviq XR, Contrave (naltrexone HCl/bupropion HCl) 8mg/90mg and Saxenda liraglutide (rDNA origin) injection pen. These medications have the same basic side effect profile including, but not limited to potential for the following: Dry mouth, nervousness, insomnia, headache, irritability, impotence or decreased libido, increased heart rate/heart palpitations, transient hair loss, dizziness, fatigue, nausea, constipation, increased blood pressure and dehydration which could cause kidney problems. *Other side effects specific to Saxenda: possible thyroid tumors (including cancer), pancreatitis, gallbladder problems, and low blood sugar (hypoglycemia). *Other medications may be prescribed at Doctor's discretion.

**Detailed information for prescribed medication regarding possible side effects/adverse reactions may be provided upon request and/or provided by pharmacy filling prescription.

These medications are not recommended for individuals with uncontrolled hypertension, hyperthyroidism, glaucoma, cardiovascular diseases, or advanced arteriosclerosis.

Medication is prescribed strictly at the discretion of our physician. Our physician restricts the use of appetite suppressants for patients under 18 or over 70. Involvement in the program should not be construed as a guarantee of receiving medical therapy. Further, medications of a less restricted nature (i.e. phentermine and diethylpropion) will be used preferentially over more restricted medications (i.e. Didrex and phendimetrazine). Use of Didrex and phendimetrazine are restricted by state law to 12 weeks of therapy in a 12-month period.

I, _____, hereby acknowledge that I have read and understand the above information. I have been informed of the nature of this weight loss program and the potential side effects of the medications that may be prescribed to me. This consent shall remain in effect until revoked by me in writing.

Patient Consent for Injections:

Injections are offered as an option to our patients. They are pharmaceutical grade injections and have not been evaluated by the Food and Drug Administration. They will be given at the discretion of the physician and/or nurse. They include, but not limited to B12, Lipotropics, essential amino acids & supplemental injections.

The substances included in the injections occur naturally in the human body and diet. We have found these supplements to be helpful with energy and fat metabolism, but we make no guarantee of weight or fat loss with the injections. Further, we do not claim that they treat, prevent or cure any disease. We expect no adverse reactions. However, future research of injections could discover adverse side effects that are unknown at this time. Please discuss any concerns you may have about the injections with the nurse or physician.

The injections are generally not to be given if you have had heart attack (MI) or a hemorrhagic (bleeding) stroke, or if you are pregnant or nursing. Please inform a Healthy Size staff member if you have had either of these conditions.

The injections are given intramuscularly. Bruising is a normal potential side effect of intramuscular injections; it needs to be brought to the attention of the physician or nurse only if it occurs repeatedly. Swelling, infection, severe pain, and/or numbness and tingling are other potential side effects. These side effects should be brought to the attention of the physician or nurse immediately, should they occur.

I _____, hereby acknowledge that I have read and understand the above information and the potential side effects of these injections. This consent shall remain in effect until revoked by me in writing.
